

Óptica geométrica

(UNIRG - TO) O esquema a seguir representa um eclipse solar, no qual a Lua, ao passar entre a Terra e o Sol, produz regiões de umbra (cone de sombra), penumbra e antumbra. Na região da umbra, o eclipse é total (A), na região de penumbra, o eclipse é parcial (C) e na antumbra é anular (B).

Disponível em: [Eclipses_solares.en.png](#) >. Acesso em 28 out. 2016. [Adaptado]

Essas regiões acontecem porque os raios que partem do Sol

- a) são independentes.
- b) interferem-se ao passar pela Lua.
- c) são reversíveis.
- d) propagam-se retilineamente.
